**MHPH**  
C₆H₈N₄O₂·HCl, MW 240.65  
Catalog# S-1009

MHPH (Solulink catalog: S-1009) is a maleimide that converts thiols on biomolecules and surfaces to HyNic linker molecules for conjugation to 4FB-modified biomolecules.

**Introduction to Solulink Bioconjugation Technology**

Solulink's core technology is based on the formation of a stable aromatic bond formed from an aromatic hydrazine and an aromatic aldehyde. S-HyNic 1 (succinimidyl 6-hydrazinonicotinate acetone hydrazone) is used to incorporate aromatic hydrazine linkers on biomolecules. S-HyNic is an amino-reactive reagent that directly converts amino groups on biomolecules and surfaces to HyNic groups. S-4FB 2 (succinimidyl 4-formylbenzoate, SFB) is used to convert amino groups to aromatic aldehydes (4-formylbenzamide (4FB) groups). Addition of a HyNic-modified biomolecule to a 4FB-modified biomolecule or surface directly leads to the formation of the conjugate (Figure 1). The conjugate bond is stable to 92°C and pH 2.0-10.0. The recommended pH for antibody conjugation is 6.0. Unlike thiol-based conjugation protocols where reducing reagents are required that can compromise the activity of proteins by cleaving disulfide bonds, the HyNic-4FB conjugation couple leaves disulfide bonds intact. No oxidants, reductants or metals are required in the preparation of conjugate.

Further enhancing the many advantages of the HyNic/4FB conjugation couple is the discovery by Dirksen et al. 1 that showed that aniline catalyzes the formation of this Schiff’s base. This is especially effective for large biomolecule conjugations. In the case of antibody-protein conjugations the addition of 10 mM TurboLink Catalyst Buffer (aniline) to the reaction mixture converts >95% of the antibody to conjugate in ~2 hours using 1-2 mole equivalents of second protein.

![Figure 1](image1.png)

The HyNic-4FB conjugation couple is chromophoric - the conjugate bond absorbs at 354 nm and has a molar extinction coefficient of 29000. This allows (1) real time spectrophotometric monitoring of a conjugate reaction, (2) ability to ‘visualize’ the conjugate during chromatographic purification using a UV or photodiode array detector and (3) quantification of conjugation. Furthermore, the level of incorporation of HyNic groups can be quantified colorimetrically as reaction with 2-sulfobenzaldehyde (Solulink catalog# # S-2005-100) yields a chromophoric product that absorbs at A350 with a molar extinction coefficient of 20000 (Figure 2). Links to procedures and calculators to guide users through this process are given in the procedures below.

Modification Procedure

A. Desalting procedure
1. Desalt/buffer exchange the protein or oligonucleotide into Modification Buffer (100 mM sodium phosphate, 150 mM sodium chloride, pH 8.0); if needed, refer to the Protein Desalting Protocol or Oligonucleotide Desalting Protocol, if needed.

Notes:
   a) High-level buffering capacity, i.e. 100 mM phosphate, is necessary for successful modification.
   b) For desalting proteins Solulink recommends Pierce Zeba Desalt Spin columns (# 89882); for oligonucleotides, Sartorius Vivaspin diafiltration units (VS0112). Refer to desalting protocol for either apparatus.

B. Determine the concentration of the protein
1. Determine the concentration of the protein to be modified using a Bradford assay (BioRad, #500-0006) or the BCA assay (ThermoScientific, #23223). Alternatively the A280 can be used if the protein extinction coefficient is known (E1%).
2. Adjust the concentration to 1-2.5 mg/mL in Modification Buffer pH 8.0, if necessary.

C. Prepare a MHPH/DMF stock solution
1. Prepare a stock solution of MHPH in anhydrous DMF (or DMSO) by dissolving 2-4 mg of MHPH in 100 µL anhydrous DMF.

Note:
   a) The MHPH/DMF stock solution is stable for 2 weeks if prepared with anhydrous DMF (Solulink catalog# S-4001) and stored desiccated.

D. Modification of a protein or oligonucleotides
1. In most cases, a reduction step is required to break disulfide bonds prior to modification with MHPH. To do this, add 1/10<sup>th</sup> volume of 10 mM TCEP·HCl in molecular grade water to the buffer-exchanged protein; If the protein being modified already contains free thiols, this step may not be required.
2. Using Table 1 as a guide, add the requisite volume of MHPH/DMF to the protein solution; refer to the Protein Modification With An NHS Ester Calculator or Amino-Oligonucleotide Modification With An NHS Ester Calculator, if needed.
   a. Note: be sure to use the correct values for MHPH in the Reagent Information section of the calculator.
3. Allow reaction to incubate at room temperature for 2.0 hours.

E. Desalting procedure
1. Desalt/buffer exchange the protein or oligonucleotide into Conjugation Buffer (100 mM sodium phosphate, 150 mM sodium chloride, pH 6.0); if needed, refer to the Protein Desalting Protocol or Oligonucleotide Desalting Protocol, if needed.

F. Quantifying molar substitution ratio
1. The molar substitution ratio (MSR) can be determined using a colorimetric reaction outlined in Figure 2. Addition of 2-sulfobenzaldehyde to a HyNic-modified biomolecule yields a bis-arylhydrazone that absorbs at 350 nm. Refer to the HyNic-Protein Colorimetric MSR Calculator or the HyNic-Oligonucleotide Colorimetric MSR Calculator as well as the protocol that is appropriate for your lab equipment: HyNic Colorimetric MSR Assay Protein Nanodrop Method Protocol, HyNic Colorimetric MSR Assay Protein Spectrophotometer Method Protocol, HyNic Colorimetric MSR Assay Oligonucleotide Nanodrop Method Protocol, or HyNic Colorimetric MSR Assay Oligonucleotide Spectrophotometer Method Protocol.
2. The biomolecule is now HyNic-modified and ready for conjugation to 4FB-modified biomolecules and surfaces.

Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protein was not modified or poorly modified.</td>
<td>Protein has been contaminated with amine containing compounds</td>
<td>Desalt the protein more thoroughly with a new Zeba Spin column or VivaSpin diafiltration device. Increase the concentration of the protein to &gt;2.0 mg/mL.</td>
</tr>
<tr>
<td></td>
<td>The concentration of the protein was too low</td>
<td></td>
</tr>
<tr>
<td>MHPH was hydrolyzed</td>
<td>Wet or poor quality DMF/DMSO hydrolyzed the NHS ester</td>
<td>Use a good quality anhydrous DMF/DMSO to solubilize the MHPH molecule.</td>
</tr>
</tbody>
</table>

Stability
The stability of HyNic groups on proteins and other biomolecules varies. It is recommended to conjugate HyNic-modified biomolecules immediately.
